

Clinical Trial Site Networks vs. Independent Sites:

A Case For Why You Need Both

When it comes to clinical trial site networks and independent sites, it's not a question of one versus the other. It's realizing that each type of site offers distinct benefits, and that it makes sense to include both in your clinical research network.

SITE NETWORKS

INDEPENDENT SITES

SPECIALIZATION

Are designed for scale and typically manage routine clinical trials.

Can easily adapt and have the expertise to lead rare disease or logistically complex studies.

RECRUITMENT

Generally enroll the majority of patients at a small percentage of sites, while others may struggle to meet their targets.

Have strong relationships with local healthcare providers that allow for targeted recruitment efforts toward diverse populations.

AGILITY

Operate under a centralized framework for data collection, patient care, and regulatory compliance.

Have fewer administrative barriers, allowing for quick pivots when trial adjustments are needed.

PERSONALIZATION

Rely on standardized workflows to support a uniform experience for patients across various site locations.

Complement this standardization with individualized support that helps keep patients engaged and reduces dropout.

MANAGEMENT

Require communication and coordination across multiple sites to ensure alignment and adherence to the same standards.

Typically operate with smaller teams (with a lower turnover rate) and simpler hierarchies that streamline the oversight of studies.

As an independent clinical research site, Remington-Davis can complement the strengths of your site network.
